

# Hill's Healthy Weight Protocol morphometric measurement instructions – CANINE

Patient \_\_\_\_\_

Date \_\_\_\_\_

Age \_\_\_\_\_ Current weight \_\_\_\_\_

## Hill's Healthy Weight Protocol results

BFI: \_\_\_\_\_

Ideal weight: \_\_\_\_\_

Accurate measurements are important to ensure an accurate results. Measure as close as possible to skin surface. Measuring tape should be snug around the body part, but not so snug that it causes an indentation. Record the numbers in centimeters to one decimal point. Double check your measurements.

Record final measurements below. Enter data at [HWP.HillsVet.com](http://HWP.HillsVet.com). Record results above and file with patient data.

## 4 CANINE MEASUREMENTS

### Head length

Measure from level of medial canthus equidistant between eyes to external occipital protuberance.

\_\_\_\_\_cm

### Front leg length

Measure from proximal edge of central foot pad to point of elbow (olecranon process). Carpus must be straight.

\_\_\_\_\_cm

### Head circumference

Measure circumference by placing tape equidistant between eyes and ears at widest part of head.

\_\_\_\_\_cm

### Hind leg length

Measure from proximal edge of central foot pad to tip of hock (dorsal tip of calcaneal process). Tarsus must be straight.

\_\_\_\_\_cm
